

Collection Reasoning

I used the ArrayList of Tickets for my choice of collection for this assignment. There was no need to sort any of the tickets as they were automatically going to be in order within the file, starting from a beginning ticket number of 100. Sorting would also serve no purpose within the scope of the program as requested. I have extensively used ArrayLists in the past, so this was very easy to implement. It was simple to iterate through the list to check for a certain ticket number via `get()`, and then pull the relevant information from there in order to print resulting ticket prices and overall totals.
